

Homework Review - 10.1

(37)

$$y = 6x^2 + 3$$

$$y = ax^2 + 3$$

$$9 = a(-1)^2 + 3$$

$$\begin{array}{cc} 9 & = a + 3 \\ -3 & \quad -3 \end{array}$$

$$a = 6$$

$$y = -7x^2 + (+11.5)$$

$$y = (-7)x^2 + 11.5$$

$$y = ax^2 - c$$

$$4.5 = a(1^2) - c$$

$$4.5 = a - c$$

$$-16.5 = a(-2)^2 - c$$

$$-16.5 = 4a - c$$

$$4.5 = a - c$$

$$+16.5 = 4a + c$$

$$\begin{array}{r} 21 = -3a \\ \hline -3 \quad -3 \end{array}$$

$$a = -7$$

$$\begin{array}{r} 4.5 = -7 - c \\ +7 \quad +7 \end{array}$$

$$(-1)11.5 = -c(-1)$$

$$-11.5 = c$$

Graphing Quadratics - $y = ax^2 + bx + c$

What will it look like?

$$y = 2x^2 - 3x + 6$$

x	y
0	6
1	5
-1	11
2	8
-2	20
3	15

General Guidelines:

$$y = ax^2 + bx + c$$

$$y = 2x^2 - 3x + 6$$

Does it open up or down? (Smiley or Frowny)

 $a > 0$: up $a < 0$: down

Is it narrower or wider than the parent function?

 $-1 < a < 1$: wider

Where is the axis of symmetry?

$$x = \frac{-b}{2a}$$

Where is the vertex?

$$x \text{ coord.} = \frac{-b}{2a}$$

y coord. = plug x into eq.

Where is the y-intercept?

$$c$$

$$\begin{aligned}
 y &= 2\left(\frac{3}{4}\right)^2 - 3\left(\frac{3}{4}\right) + 6 \\
 &= 2\left(\frac{9}{16}\right) - \frac{9}{4} + 6 \\
 &= \frac{18}{16} - \frac{36}{16} + \frac{96}{16} \\
 &= \frac{78}{16} = \frac{39}{8} = 4\frac{7}{8}
 \end{aligned}$$

$$\begin{array}{r}
 3 \\
 16 \\
 \underline{6} \\
 96 \\
 \underline{-18} \\
 78
 \end{array}$$

Graph $y = ax^2 + bx + c$

1. Determine whether the graph opens up or down

$$a < 0$$

2. Find and sketch the axis of symmetry

$$-b/2a$$

$$-8/2(-2) = \frac{-8}{-4} = 2$$

3. Find and plot the vertex

$$(2, 12)$$

$$y = -2(2)^2 + 8(2) + 4$$

$$= -8 + 16 + 4 = 12$$

4. Plot two points - the y-intercept and one other point (on the same side of the parabola)

x	y
0	4
-1	6

5. Reflect the other side of the parabola

6. Draw the curve

$$y = -2x^2 + 8x + 4$$

$$y = -x^2 - 10$$

$$y = -2x^2 + 2x + 1$$

Finding the maximum or minimum of a quadratic

If the graph opens up, it has a minimum.

If the graph opens down, it has a maximum.

Find the vertex and identify it as a minimum or maximum:

$$y = -\frac{1}{2}x^2 + 2x - 4$$

(-2)
maximum

$$x = \frac{-b}{2a} = \frac{-2}{2(-\frac{1}{2})} = \frac{-2}{-1} = 2$$

$$\begin{aligned} y &= -\frac{1}{2}(2)^2 + 2(2) - 4 \\ &= -2 + 4 - 4 \\ &= -2 \end{aligned}$$

32. $f(x) = 8x^2 - 40$

33. $f(x) = -5x^2 + 10x - 2$

$$y = 8x^2 - 40$$

$$f(x) = 8x^2 - 40$$

Storage Building The storage building shown can be modeled by the graph of the function $y = -0.12x^2 + 2.4x$ where x and y are measured in feet. What is the height h at the highest point of the building as shown in the diagram?

$$x=10$$

$$y=12$$

$$x = \frac{-b}{2a} = \frac{-2.4}{2(-0.12)} = \frac{+2.4}{+0.24} = 10$$

$$\begin{aligned}
 y &= -0.12x^2 + 2.4x \\
 &= -0.12(10)^2 + 2.4(10) \\
 &= -0.12(100) + 24 \\
 &= -12 + 24 \\
 &= \boxed{12}
 \end{aligned}$$
