

# Noyes Project Introduction

## *Field Biology*

This introduction will identify the potential study you are thinking of carrying out at the Noyes Property. This assignment is an individual assignment, and it needs to be typed. At this point, you should be working on your own project; later, you will choose a partner and pick one of your proposals as a final project. This assignment is due at the end of the period on Monday, November 4<sup>th</sup>; please e-mail it to [dan.bregar@corvallis.k12.or.us](mailto:dan.bregar@corvallis.k12.or.us) with the subject “per X your name Noyes Introduction”.

Your introduction should describe what you will investigate at the Noyes property and give information that explains the ecological importance of your study. This is a formal paper, so it should be in paragraph form. Use this format to compose your document.

1. Question: In “what is the relationship between” form, write the question that you will be trying to answer. Make sure you have a good measuring word for each factor! Add one or two sentences of background information to support your question.
2. Background Information: This section of your proposal should consist of two parts:
  - a. A paragraph that describes the ownership information, soil information, and hydrological information about the Noyes property, along with an aerial photograph of our project site. This information is available in the “[Noyes Property Location Information](#)” assignment on my website that we worked on earlier. If you haven’t completed this assignment you can use it as a guide for this part of your background information.
  - b. The two paragraphs you wrote for the “[Noyes Property Project Initial Research](#)” assignment. If you haven’t finished this assignment, or can’t find your work, you can look at it and use it to guide your writing. At this point, it is acceptable to leave your citations as informal URL’s.
