

Homework
review - p. 247

32

$$y = 5x - 7 \quad \text{slope} = 5$$

$$\begin{array}{r} 5x + y = 7 - 5x \\ -5x \end{array}$$

$$y = -5x + 7 \quad \text{slope} = -5$$

Not parallel -
Slopes wren't the same

36

$$6x + y = 24 - 6x$$

$-6x$

$$y = -6x + 24$$

slope = -6

$$y = -6x - 4213.187652410962154$$

slope = -6

Quiz tomorrow

- Over sections 4.1-4.5

- graph coordinate pairs

- graph lines using all 3 methods:

1. Coordinate pair method

2. X- and Y- intercept method

3. slope | intercept method

- You can use your tri-fold graphing organizer

you get
credit for
this
not
this

Coordinate Pair Method:

① Write the equation in $y = mx + b$ form:

$$2x + 4y = 8 - 2x$$

$-2x$

$$\frac{4y}{4} = \frac{-2x + 8}{4}$$

$$y = -\frac{1}{2}x + 2$$

② Make a table showing 2 values of x & y .

Pick an x (from the specified domain) &

Solve for y

x	y
2	1
-2	3

$$y = -\frac{1}{2}(2) + 2$$
$$= -1 + 2$$
$$= 1$$

$$y = -\frac{1}{2}(-2) + 2$$
$$= 1 + 2$$
$$= 3$$

③ Graph the coordinate pairs and draw the line.

② X- and Y- intercept method

① Find the y-intercept (set $x=0$)

$$\begin{aligned} 6x + -3y &= 12 \\ 6(0) + \frac{-3y}{-3} &= \frac{12}{-3} \\ y &= -4 \end{aligned}$$

y-intercept:
 $(0, -4)$

② Find the x-intercept (set $y=0$)

$$\begin{aligned} \frac{6x + -3(0)}{6} &= \frac{12}{6} \\ x &= 2 \end{aligned}$$

x-intercept
 $(2, 0)$

③ Graph the coordinates
and draw the line:

Slope-intercept form:

1. Put the equation in $y = mx + b$ form

$$3y - 2x = -3 + 2x$$

+ 2x

$$\frac{3y}{3} = \frac{2x - 3}{3}$$

$$y = \frac{2}{3}x - 1$$

2. Find the slope (m) and the y -intercept:

$$m = \frac{2}{3} \quad y\text{-intercept: } -1 \quad (0, -1)$$

3. Plot the y -intercept

4. Use the slope to find another point.

$$m = \frac{\text{rise}}{\text{run}} \rightarrow$$

$$m = \frac{2}{3} = \frac{\text{rise}}{\text{run}}$$

go "rise" away from the y -intercept on the y -axis

go "run" away the y -intercept on the x -axis

5. Draw the line

Slope:

$$m = \frac{y_2 - y_1}{x_2 - x_1}$$

$$= \frac{\text{rise}}{\text{run}}$$
