

Soil exploration lab report:

What was your hypothesis (did you think your experimental measurement will match the online measurement you found?)

What methods will you use to test your hypothesis? (What tools did you use? How did you use those tools etc)

Report your measurements:

1. What is the difference between a theoretical number and an experimental number
2. Did you experiential water retention amount match the theoretical?
3. Explain why the theoretical may not match the experimental perfectly
4. What could you have done in your experiment to bring the experimental measurement closer to the theoretical
