

Homework Quiz Friday 10/16

- Around 15 mins.
- You can use your homework
- Quiz will be similar (in style & complexity) to a homework problem.
- Material: reviewed last week

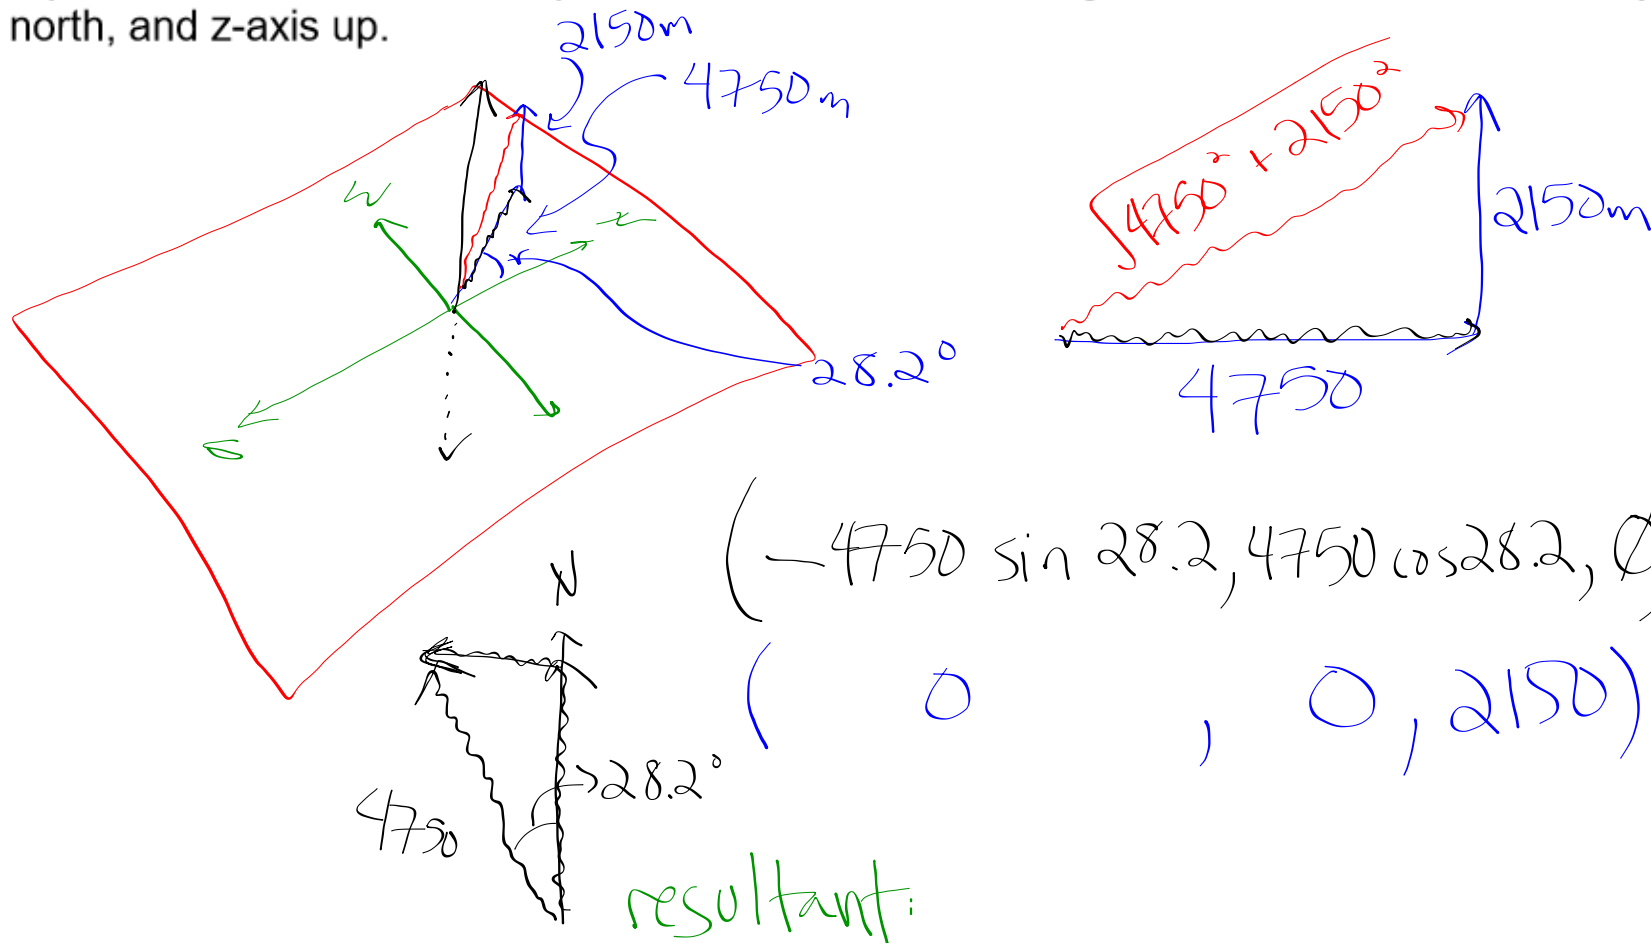

Match motion lab report:

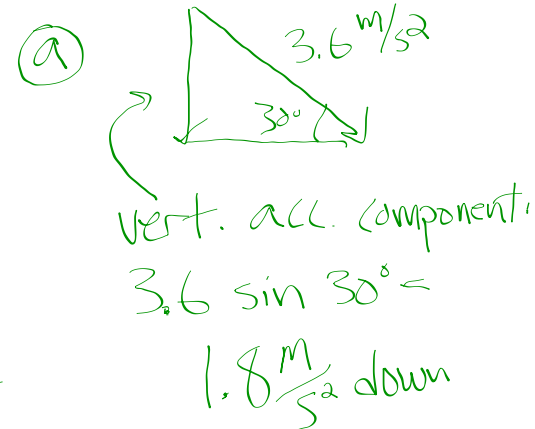

★ It's OK to be brief—show
me evidence of learning

★ CHECK WITH ME

17. The summit of a mountain, 2150 m above a camp, is measured on a map to be 4750 m horizontally from the camp in a direction 28.2° west of due north. What are the components of the displacement vector from camp to summit? What is its length? Choose the x-axis east, y-axis north, and z-axis up.

12. A skier is accelerating down a 30.0° hill at 3.60 m/s^2 .
- What is the vertical component of her acceleration?
 - How long will it take her to reach the bottom of the hill, assuming she starts from rest and accelerates uniformly, if the elevation change (elevation is a measure of the vertical direction) is 150 m ?

(b)

$$x_0 = 0$$

$$x = 300 \text{ m}$$

$$v_0 = 0 \text{ m/s}$$

$$v =$$

$$a = 3.6 \text{ m/s}^2$$

$$t =$$

$$x = x_0 + v_0 t + \frac{1}{2} a t^2$$

$$300 = \frac{1}{2} (3.6) t^2$$

$$t = \sqrt{\frac{2(300)}{3.6}} = 12.9 \text{ s}$$

Preliminary Lab:

- We can look at the motion of objects as independent, perpendicular components \rightarrow We can use the big 4 completely separately for x - and y -variables (linked by t)

+

- ① toss a ball —
capture the motion
- ② find a_x and a_y
- ③ toss it again
- ④ use initial v_x
 v_y values to
predict...
