

# Noyes Project:

- You will:
  - Develop a WITRB question you could ask about Noyes Property
  - Research the ecological importance of your question and potential methods for answering it by collecting data
  - Collect & analyze data
- Documentation of your work due in early June

## Parameters:

- SAFETY
- Timing - measurements will be taken in the spring over a relatively short period of time
- Stick with what you know or will know:  
plant ecology, water<sup>?</sup> quality, soil properties, soil organisms, lichens

We'll start by brainstorming "What is the relationship between" questions.

---

WITRB amount of organic material  
measurement 1 of Soil  
thing 1  
and species composition  
measurement 2 of bugs  
thing 2 ?

- make sure your measurements are easily understood
- there should be a potentially interesting interaction between thing 1 & thing 2
